

Recommendations for the examination of adult female suspects of sexual assault

Aug 2022 Review date Aug 2025 - check www.fflm.ac.uk for latest update

The medico-legal guidelines and recommendations published by the Faculty are for general information only. Appropriate specific advice should be sought from your medical defence organisation or professional association. The Faculty has one or more senior representatives of the MDOs on its Board, but for the avoidance of doubt, endorsement of the medico-legal guidelines or recommendations published by the Faculty has not been sought from any of the medical defence organisations.

Principles

Suspects of any gender have the right to high quality therapeutic and forensic care from an appropriately trained Healthcare Professional (HCP) (see below).

When performing intimate examinations of adult female suspects of sexual assault under arrest and detained in police custody consideration must be given to the following key principles:

1. The examination must take place in an appropriate environment;
2. The HCP conducting the examination must be appropriately trained (theoretical knowledge) and have the necessary competencies (skills);
3. Cross contamination must be avoided.

HCPs are not necessarily skilled in both General Forensic Medicine (GFM) and Sexual Offence Medicine (SOM). Therefore there may be a need for a joint examination to be performed. Each case should be carefully considered and a decision made on an individual basis. Arrangements should be made to work in partnership with the local SARC.

The Police must ensure that they have in place commissioned services to include the assessment and management of female (including transgender) suspects where intimate samples may be needed.

Environment

The examination of any suspect should be performed in an appropriate environment with privacy and access to the necessary equipment.¹

In the case of a female suspect the necessary equipment will include:

- A couch with appropriate lighting to perform a vaginal examination;
- Access to disposable instruments (proctoscope, speculum);
- The full range of forensic kits.²

If the examination is to be performed in a police station, the local sexual assault referral centre (SARC) may be able to provide some of the necessary equipment, such as a head lamp from an out-of-SARC examination bag used to perform examinations in sites other than a SARC, e.g. a hospital/prison. Alternatively the local or neighbouring county SARC may be willing to do an examination in the SARC facility.

In either case this may be a joint examination depending on the skill set of the individual practitioner.

If a suspect is moved to a SARC there will be security issues to be addressed. If, on rare occasions, a suspect is taken to the SARC care needs to be taken to avoid coincident or concurrent attendance of the complainant not just for contamination concerns but for the complainant's emotional wellbeing.

Competencies of the HCP³

The HCP should be competent to perform the examination required and must have the following knowledge and skills:

1. Understanding of the law (the requirements of the Police and Criminal Evidence Act (PACE) and the associated Codes of Practice) in relation to those detained by the police and the science behind the taking of forensic samples;
2. Knowledge of the current FFLM recommendations on the range of appropriate forensic samples to be taken from suspects;⁴
3. Competent to perform an ano-genital examination, pass a speculum and proctoscope, identify and document injuries accurately;
4. Colposcopy imaging of injuries may be required, therefore access to a colposcope is essential including an appropriately skilled practitioner to support the HCP;
5. Forensic samples should be taken in line with the [FFLM recommendations](#). The HCP should take the intimate samples and self-swabbing should only be considered if the suspect declines to have swabs taken and consents to taking self-swabs. In cases where self-swabs are taken, the HCP should document clearly the discussions with the suspect, including instructions of how to take the samples, where they were taken e.g., examination room, and if anyone observed the swabs being taken.

Contamination reduction⁵

Different HCPs should examine the complainant and suspect from the same incident, in separate facilities, to prevent cross contamination. Disposable barrier clothing should be worn to minimise the risk of contamination.

Appropriate cleaning of the area/facility and equipment to be used for the examination should be carried out using suitable cleaning agents, both pre and post examination.
